

The Lucent Library of Science and Technology - The Search for Extraterrestrial Life

Scientists have long suspected the the human race is not alone in the universe. Although no direct evidence for ET life has yet been found, a great deal of circumstantial evidence suggests that it will be found in the near future. Since 1995, scientists have detected more than 120 planets orbiting other stars. And oceans of liquid water have been located beneath the surfaces of several moons in our solar system. This fascinating volume explores the scientific probabilities of ET life and current scientific efforts to find it.
